Pages: 17

---

This instruction implements Department of the Air Force Policy Directive (DAFPD) 11-4, *Flying Operations Aviation Service*. It provides guidance and procedures for the management of G-performance risk factors that may be experienced by student pilots in the USAF Basic Operational Training Course (B course) at Luke AFB AZ. It references Air Force Manual (AFMAN) 11-404, *Fighter Aircrew Acceleration Training Program.* These procedures apply to all flying squadrons in the 56th Operations Group (56 OG). AFMAN 11-403, *Aerospace Physiological Training Program*, complements this instruction by providing detail on the training requirements for Aerospace Physiologists (AP) and technicians. Air Force Pamphlet (AFPAM) 11-419, *G-Awareness for Aircrew*, provides comprehensive information on the physiology of acceleration in flight. This publication applies to the Air Force Reserve Command (AFRC) and to Air National Guard (ANG) and their units. Refer recommended changes and questions about this publication to the OPR using the DAF Form 847, *Recommendation for Change of Publication*; route DAF Forms 847 from the field through the appropriate functional chain of command. Ensure all records generated as a result of processes prescribed in this publication adhere to Air Force Instruction (AFI) 33-322, *Records Management and Information Governance Program*, and are disposed in accordance with the Air Force Records Disposition Schedule, which is located in the Air Force Records Information Management System. This publication may not be supplemented or further implemented or extended. The authorities to waive wing, unit, delta or garrison level requirements in this publication are identified with a Tier ("T-0, T-1, T-2, T-3") number following the compliance statement. Submit requests for waivers through the chain of command to the appropriate tier waiver approval authority or alternately to the publication OPR for non-tired

compliance items. See DAF Manual (DAFMAN) 90-161, *Publishing Processes and Procedures,* for a description of the authorities associated with the tier numbers.

This publication requires the collection and/or maintenance of information protected by the Privacy Act (PA) of 1974. The authorities to collect and or maintain the records prescribed in this publication are Title 10 U.S.C. Sections 133 and 8013. Forms affected by the PA have an appropriate PA statement. System of records notice F044 AF SG H, Air Force Aerospace Physiology Training Programs, applies. The use of the name or mark of any specific manufacturer, commercial product, commodity, or service in this publication does not imply endorsement by the Air Force.

***SUMMARY OF CHANGES***

This document had minor changes made to the functional management of the pre-screen process at the unit level, updated acronyms, updated contact information for Wright Patterson AFB centrifuge operations, and updated research based information for GLOC and ALOC durations**.** The overall intent and execution of the G-Risk Indicator Management (GRIM) program remains the same.

# Chapter 1

# INTRODUCTION

1.1. **Purpose and Need for G-performance Risk Management.** The high-performance aircraft operated by Luke AFB student pilots are easily capable of causing G-induced loss of consciousness (G-LOC). An effective anti-G straining maneuver (AGSM), optimum physical conditioning, functioning anti-G equipment and adequate G-oriented situational awareness are all important to aircrew G-performance. Early detection of G-performance risk indicators can aid in the establishment of tailored ground training programs designed to optimize a student's performance under G.

1.1.1. GRIM consists of initial assessment of a student's previous high-G-performance and present physical condition at the start of basic course ground training and assessment of student's performance under G while flying. Observations from these assessments are used to qualitatively determine the level of risk for the student and, if necessary, assist in development of tailored training programs for the student's specific needs.

1.1.2. The purpose of GRIM is to optimize combat capability and safety through the following methods:

1.1.2.1. Identify aircrew with a propensity towards poor G-performance prior to conversion training phase.

1.1.2.2. Assist these aircrew in the development of habit patterns and lifestyle decisions/management that will optimize their G-performance throughout the B course and beyond.

1.1.2.3. If students in Transition or Senior Operator courses demonstrate problems with G-performance while at Luke, GRIM program definitions, courses of action and control measures may be utilized at the discretion of FS CC/DO. However, these students need not be officially on GRIM nor follow the precise flow of the GRIM program as intended for B-course students.

1.2. **Explanation of Terms:**

1.2.1. Anti-G Straining Maneuver. Sustained lower body muscle tensing/straining and short air exchanges against a closed glottis in 2.5-3.5-second cycles.

1.2.2. G. Any force that produces an acceleration of 32.2 feet per second, which is equivalent to the acceleration produced by earth's gravity.

1.2.3. G-tolerance. The ability or capacity to maintain vision, consciousness, and effective performance when under G-stress.

1.2.4. G-endurance. The ability to sustain G for the duration required by the flying scenario.

1.2.5. Inadequate G-performance. Any G-related incident to include light loss, blackout, or inadequate AGSM mechanics (as determined by IP/AP/Flight Surgeon) that results in a failure to meet training objectives or requires modification of the usual G profiles associated with any flying activity.

1.2.6. Light Loss. Any peripheral light loss or general vision loss experienced under G which adversely impacts mission accomplishment and/or causes deviation from the prescribed maneuver

or mission profile (i.e., Terminate or KIO). **Note:** Instructor pilot and commander judgment will determine what constitutes a significant impact to the mission. It is important to recognize that *transient peripheral vision loss* that is easily recovered by either appropriate reduction of G loading or by increased intensity of the AGSM are a normal part of flight in the high-G arena and should not be confused with a *light loss incident*.

1.2.7. Blackout. Complete vision loss experienced under G, but not accompanied by subsequent loss of consciousness.

1.2.8. GLOC. The transition from normal consciousness to a state of unconsciousness that results when blood flow to the central nervous system under G is reduced below critical levels to support conscious function. GLOC symptoms include: loss of consciousness followed by myoclonic convulsive activity (muscle twitching), confusion, disorientation and memory loss. Absolute incapacitation can range from 2-37 seconds and relative incapacitation can range from 3-46 seconds.

## Chapter 2

## GRIM RISK CONTROL INDICATIONS, PROCEDURES AND ADMINISTRATION

2.1. **Overview.**

2.1.1. Many variables come into play in maximizing G-performance and in preventing GLOC. Although the individual aviator is ultimately responsible for his or her mental and physical condition, there are sources of information available to supervisors that may reveal a student's predisposition for poor G-performance in the aircraft. The following paragraphs describe some of these risk indicators and the preferred procedures and protocols for their control or elimination.

2.1.1.1. Records Review: A thorough review of training records may reveal trends that could indicate poor G-performance.

2.1.1.2. Flight commanders (Flt CC) will check for problems with AGSM and G-tolerance by reviewing the grade book. The AP will check the same from student acceleration qualification training report AF Form 4293, *Student Activity Record*. (Should the AF Form 4293 not be in the student's grade book, the student's squadron commander or equivalent must request a replacement. Wright-Patterson AFB centrifuge **342trs.trpa.accelerationsection@us.af.mil**.)

2.1.1.3. The 56 TRS/TRP will document findings of significance in a GRIM spreadsheet/database and provide GRIM recommendations to the Flt CC, FS, and Sq CC/DO (Located on the Operations Group drive). Based upon inputs from the Flt CC, TRP & FS, the flying Sq CC/DO will make the final determination that a student be placed on the GRIM program. Flt CCs may use **Attachment 5** as a reference to document student placement on GRIM.

2.1.1.4. Implement appropriate risk control if necessary (See **Chapter 3**).

2.1.2. Aircrew Conditioning Program Assessment (ACPA):

2.1.2.1. Assess all B-Course students prior to start fly date.

2.1.2.2. 56 TRS/HPT will administer and assess ACPA results.

2.1.2.3. Summary of results for students exhibiting marginal physical abilities will be documented in a GRIM spreadsheet/database and brought to the attention of the flying Sq CC/DO.

2.1.2.4. Implement appropriate risk control if necessary (See **Chapter 3**).

2.1.3. Centrifuge Video Review. The 56 TRS/TRP can request a centrifuge video review from the Wright-Patterson AFB centrifuge for students demonstrating problems in any of the previously mentioned areas.

2.2. **Inadequate G-performance resulting in significant mission impact:**

2.2.1. Squadron Aircrew Flight Equipment will check the student's equipment and report any malfunctions to the student's Sq CC/DO.

2.2.2. Evaluation.

2.2.2.1. The AP and/or FS will review Heads-Up Display video and will interview student and IP.

2.2.2.2. Student is immediately referred to Flight Medicine Clinic if not met at the aircraft for physical examination and evaluation by FS. Results will be briefed to Sq CC/DO & AP.

2.2.2.3. Implement appropriate risk control (GRIM) if necessary (See **Chapter 3**). Consider placement on GRIM.

2.2.2.4. No physiological safety report is required. The FS or AP will complete an incident report and distribute to Sq CC/DO/Flt CC and 56 FW/SE as well as the other OG Flt Surgeons for review.

2.2.2.5. F-35 students will be assigned to fly the next sortie IAW Commander's Awareness Program (CAP) supervision. This does not place the student on CAP but is intended to allow them to continue flying if deemed safe by Squadron leadership, while having experienced IP supervision during the flight. Consider maintaining student on GRIM.

2.3. **GLOC (Incapacitation):**

2.3.1. Squadron AFE will check student's equipment using protocols described in AFI 11-301V1, Para. 3.21.1. Report any malfunctions to student's Sq CC/DO.

2.3.2. Evaluation.

2.3.2.1. F-35 students will be assigned to fly the next sortie IAW Commander's Awareness Program (CAP) supervision. This does not place the student on CAP but is intended to allow them to continue flying if deemed safe by Squadron leadership, while having experienced IP supervision until cleared by Sq CC/DO to resume normal syllabus directed training.

2.3.2.2. The AP or FS will review HUD video and will interview student and IP.

2.3.2.3. Student is referred to Flight Medicine Clinic for physical examination.

2.3.2.3.1. FS and/or AP will coordinate with flight safety for AFSAS/Physiological Incident Report, IAW DAFMAN 48-123, *Medical Examinations and Standards* and DAFI 91-204, *Safety Investigations and Reports*.

2.3.2.3.2. If a medical condition is suspected to be diminishing the student's G- tolerance or G-endurance, a medical waiver will be required for continued flying duties IAW DAFMAN 48-123.

2.3.2.4. If necessary, 56 TRS/HPT can conduct a physical and/or cognitive training test to quantify any suspected physical/attention management performance weaknesses.

2.3.2.5. Student's high-G performance and options for risk control will be evaluated jointly by the AP, FS, Aviation Psychologist (if available), Flt CC, and the FS CC/DO.

2.3.3. Implement appropriate risk control/GRIM if necessary (See **Chapter 3**). If the FS/CC chooses to utilize Commander Directed Acceleration Training, 56 TRS/TRP can help facilitate scheduling the training with the Wright-Patterson AFB centrifuge (**342trs.trpa.accelerationsection@us.af.mil**).

2.4. **Centrifuge failure or persistently inadequate G-performance:** With recommendation of the FS/CC, student will be considered for removal from the flying training program and considered for a low-G weapon system training program.

2.5. **Administration.**

2.5.1. Following each GRIM monitored training event (See **Attachment 4**), a write-up shall be made referencing the evaluation of the pilot's HUD video review and AGSM/fitness issues (GTIMS/TR-x or BFM-x/documents/grade sheet reviews). Additionally, the AP and/or FS shall

annotate when the next review is required, as occasionally a review may be warranted prior to the next scheduled GRIM review.

2.5.2. Reasonable efforts will be made to review the prescribed GRIM sortie prior to the next flight; however, this is not required.

2.5.3. In the event that a HUD video is not captured due to mechanical malfunctions or other reasons, the next available sortie can stand as a suitable substitute for GRIM review.

2.6. **Removal from GRIM supervision.**

2.6.1. GRIM supervision will normally expire after Basic Fighter Maneuver phase. However, if during the final BFM review, the AP or FS note significant AGSM flaws, a recommendation can be made to review additional syllabus sorties for AGSM mechanics. Once the AGSM is noted as satisfactory, the student can be removed from GRIM.

2.6.2. Flt CC will generate a removal from GRIM letter upon recommendation from 56 TRS/TRP or FS.

2.6.3. In order to facilitate continuity with gaining units, the AP may notify gaining unit DOs via email or phone of any students that struggled with G performance or were on GRIM status during B course.

## Chapter 3

## GRIM RISK CONTROL OPTIONS

3.1. **Potential Options.** Risk control options include but are not limited to AGSM technique employment coaching, HUD reviews, Monitored Physical/Cognitive Conditioning Program (P/CCP), CDAT, and elimination from formal training.

3.2. **Monitored Physical/Cognitive Conditioning Program (P/CCP):**

3.2.1. Purpose: Optimize G tolerance and endurance and attention management through a specialized P/CCP.

3.2.2. Indicators:

3.2.2.1. Inadequate strength and/or endurance noted as a problem area during CAF qualification centrifuge training, CDAT failure or the 56 TRS/HPT. **Note:** If physical conditioning is deemed a significant limiting factor following centrifuge training or by 56 TRS/HPT or TRP, temporary removal from flying training may be necessary to allow sufficient time to improve the weakness. See AFMAN 11-404 for more details on CDAT.

3.2.3. Control Decision: Students who have demonstrated inadequate strength and/or endurance indicators of potential risk shall be considered by Flt CC (after consultation with AP or FS) for placement in GRIM for PCP until out of air-to-air flying training phase or until strength and endurance are deemed adequate for required performance under G. There are no pass/fail criteria for the ACPA. Discretion is left to the 56 TRS/HPT and TRP for recommendations on inadequate strength/endurance and potential utility of a monitored PCP for the student.

3.2.4. Control Implementation: Specialized/Personalized P/CCP.

3.2.4.1. Will be developed through consultation between student, 56 TRS/HPT, AP, and FS. The program will be designed to improve leg/core muscular strength/endurance. It may be tailored to meet the unique needs of the student.

3.3. **AGSM Technique Employment Coaching/HUD Review:**

3.3.1. Purpose: Decreases cognitive burden of performing the AGSM during mentally intense high-G flight maneuvers. Indicators: Inconsistent or inefficient AGSM mechanics noted as problem area during CAF qualification centrifuge training, IFF grade sheets and/or HUD review.

3.3.2. Control Decision: Students who have demonstrated an inconsistent or inefficient AGSM shall be considered by the Flt CC, AP, Aviation Psychologist (where available), or FS for consultation, coaching and GRIM.

3.3.3. Control Implementation: Consultation will include but not be limited to discussion on:

3.3.3.1. Practicing AGSM technique during chair flying and simulator training to make it a very natural part of the student's stick and rudder flying skills/habit patterns.

3.3.3.2. HUD AGSM reviews of TR-1, first Offensive BFM sortie, first Defensive BFM sortie, first High-Aspect BFM sortie, and last BFM sortie (optional) are required for GRIM. Any other sortie deemed necessary by the squadron leadership, AP or FS will also be reviewed. (See **Attachment 4**)

3.3.3.3. Development of efficient and consistent AGSM mechanics and application.

3.3.3.4. Stress and/or attention management strategies.

3.4. **Commander Directed Acceleration Training (CDAT):**

3.4.1. Purpose: CDAT is a tool that can be used by any FS/CC to evaluate and improve pilot performance under G. It can be used as a remedial tool for any degree of G-related problems and is often the best intervention method as many G-related issues only manifest under actual G-load and can be masked during chair flying. CDAT allows for correction of AGSM technique in real time with immediate performance feedback.

3.4.2. Indicators: All the risk indicators outlined in **Chapter 2** of this instruction will be considered.

3.4.3. Control Decision: Upon HUD review by Flt CC, FS, or AP, the flying Sq CC can direct CDAT.

3.4.4. Control Implementation: Scheduling CDAT: Wright-Patterson AFB centrifuge is the point of contact for scheduling CDAT. The flying squadron or the AP can contact Wright-Patterson AFB at DSN: 323-635-0373 or **342TRS.TRPA.AccelerationSection@us.af.mil**.

3.4.4.1. Duration of training is normally three days.

3.4.4.2. See AFMAN 11-404 for more details on CDAT.

3.5. **Elimination from Training:**

3.5.1. Purpose: Limits the student's exposure to the risks of high-G flight by removing him or her from training with potential redirection to a lower-G aircraft.

3.5.2. Indicators: CDAT failure, persistent inadequate G-performance or any of the risk indicators outlined in **Chapter 2** of this instruction will be considered.

3.5.3. Control Decision: With recommendation from the FS/CC, 56 TRS/TRP and FS, the student will be considered for removal from the flying training program.

3.5.4. The FS/CC/DO will notify the 56 OG/CC and 56 TRS/DO immediately upon suspected elimination of a student in a formal training course.

3.5.5. Control Implementation: Refer to AETC Syllabus F-35 CWS and DAFMAN 11-402 for administrative procedures on elimination.

NICHOLAS R. IHDE, Colonel, USAF
Commander, 56th Fighter Wing

DATE

MEMORANDUM FOR RECORD

FROM:

SUBJECT: G-Risk Indicator Management (GRIM)

1. Lt Sonny Day is being placed on GRIM. Lt Day struggled with proper AGSM mechanics at IFF. 56 TRS AP has recommended that Lt Day receive additional training and supervision to enhance G-performance.

2. Lt Day's attitude and work ethic up to this point are outstanding.

3. Capt Pail (B-Flight CC) counseled Lt Day on DATE.

4. Lt Day should accomplish the following training (Annotated in GTIMS):

| |
|---|
| **Monitored PCP (If required per 3.2)** (AP/FS/Flt CC) |
| **Preflight G-performance counseling** (Conducted by AP/FS during L100 academics) |
| **TR-1** AGSM HUD video review (AP or FS. Annotate in GTIMS) |
| **First Offensive BFM PCP review (If required per 3.2)** (AP/FS/Flt CC) |
| **First Offensive BFM** AGSM HUD video review (AP or FS. Annotate in GTIMS) |
| **First Defensive BFM** AGSM HUD video review (AP or FS. Annotate in GTIMS) |
| **First High-Aspect BFM** AGSM HUD video review (AP or FS. Annotate in GTIMS) |
| **Last BFM OPTIONAL** AGSM HUD video review (AP or FS. Conducted at discretion of AP/FS based on last BFM AGSM performance. Annotate in GTIMS) |

5. At the end of the BFM phase, an evaluation will be made by the 56 TRS AP, FS & Sq leadership to determine Lt Day's removal from GRIM.
